Feature Selection

IGR
Classification

Conclusion and Future Work

- Genre is the **most common** classification scheme used to distinguish music
- There exists a consensus of broad genre definitions **across populations** worldwide
- Similarity-based measures include mood, artist, and style.
- Genre offers a **culturally authorised prominence** on the construction of traditional classes

Progressions

Feature

Selection

IGR

Classification

Conclusion

and Future

Work

- Traditional musical aspects given by four characteristics: melody, harmony, rhythm and sound.
- Textbook definitions are qualitative and come across as subjective, context dependent and therefore are difficult to automate.
- Composers do not abide by "genre definitions"
- Humans often **cognitively** regard art and other manifestations of genre collectively (e.g. food, cloths, language, artwork, music), which could bias the study.
- Since people always disagree with what a particular genre is, correct classification becomes inescapably bounded
- Genre holds many sub-genres
- There is an awareness of genre classification performance bounds imposed by humans.

Progressions

Feature Selection

IGR

Classification

Conclusion and Future Work

- Humans are biased and subjective in their classifications
- Genre definitions evolve

Problem Statement III

Literature Review

There are very few capable genre classification systems

Benetos and Kotropoulos [2008]	75.0%
Bergstra et al. [2006]	82.5%
Holzapfel and Stylianou [2008]	74.0%
Li et al. [2003]	79.7%
Lidy et al. [2007]	76.8%
Panagakis et al. [2008]	78.2%
Sturm [2013]	83.0%
Tzanetakis and Cook [2002]	61.0%

IGR

Classification

Conclusion

and Future

Work

Briefly stated, we provide the following contributions

- A thorough review of music genre classification literature
- Features and classification algorithms never used for genre classification
- A list of features that best distinguishes different genres
- Detailed comparison of representations to build an optimal classifier

Feature Analysis

Tempo
Pitch
Chord
Progressions

Feature Selection

IGR
Classification

Conclusion and Future Work

- Acoustic content comprises of instrument sounds, speech sound, and environmental sounds.
- Human listeners try to identify these characteristics to classify a piece of music
- Four main categories:
 - 1 The Magnitude Spectrum
 - 2 Tempo Detection
 - 3 Pitch Detection
 - 4 Chordal Progressions

Feature Representations

Music Genre Classification

Feature Analysis

Representations
Magnitude
Tempo
Pitch
Chord Progressions

Feature Selection

IGR
Classification

Conclusion and Future Work

We used the following representations:

- 1 **Central Tendency:** Mean and standard deviation.
- 2 **The Feature Histogram:** The feature histogram arranges the features local window intensities into bin ranges
- 3 **MFCC Aggregation:** MFCC representation is a wellknown feature representation which takes the first n MFC coefficients of the feature samples as it would a 16khz signal.
- 4 **Area Moments:** Image moments is a central concept in computer vision and has its root in image processing.

Magnitude-based Features I

Feature Selection

IGR
Classification

Conclusion and Future Work

- The magnitude spectrum, obtained from the fast Fourier transform of a signal, houses a family of spectral features for genre classification.
- We can now identify signal change, noisiness, loudness and many other spectral features.
- Exploring peak-based features allows us to analyse the signal more thoroughly.

Magnitude-based Features II

Some of the magnitude features include:

- 1 Spectral Slope
- 2 Compactness
- 3 Spectral Decrease
- 4 Loudness
- 5 Onset Detection
- 6 Peak Detection
- 7 Spectral Flux
- 8 Spectral Variability
- 9 Mel-Frequency Cepstral Coefficients
- 10 Spectral Flatness

Magnitude-based Features III

Result Preview

149 features from the magnitude spectrum were extracted

Feature	Optimal Representation	Dimensionality
Slope	Mean	1
Compactness	Mean	2
Decrease	Mean	1
Loudness	Mean	26
Onset Detection	Mean	1
Octave Based Signal Intensity	Mean	17
Peak-based features	Mean	4
Spectral Flux	MFCC	4
Spectral Variability	MFCC	4
MFCC	MFCC	52
Flatness	Mean	20
Shape Statistics	Mean/MFCC	11
Spectral Rolloff	Mean	2
Peak Flux	20-bin FH	20
Crest Factor	Mean	10
Strongest Freq of FFT Max	MFCC	4

Table: Magnitude-based feature list

Tempo Features I

- Most music display regular rhythmic formation that creates an impression of tempo.

Tempo Features II

Some of the magnitude features include:

- 1 Energy
- 2 Beat Histogram

Andante grazioso (♩ = 120)

The image shows a musical score for a piece titled "Andante grazioso" with a tempo of 120 beats per minute. The score is written in treble and bass clefs, 6/8 time, and is in the key of D major (indicated by two sharps). The music is marked with a piano (*p*) dynamic. The score consists of two measures. The first measure contains a piano line with a slur over the first two notes, a fermata over the third note, and a slur over the last two notes. The second measure contains a piano line with a slur over the first two notes, a fermata over the third note, and a slur over the last two notes. The bass line in both measures consists of a series of chords, with a slur under the first two notes of each measure and a fermata over the third note.

Tempo Features III

Result Preview

362 tempo related features were extracted

Feature	Optimal Representation	Dimensionality
Energy	Mean	2
Fraction of low energy	Mean	2
Beat Histogram	Mean	342
Strongest Beat	Mean	2
Strength of the Strongest Beat	Mean	2
Beat Sum	MFCC	4
Relative Difference Function	MFCC	4
Temporal Shape Statistics	Mean	4

Feature Analysis

Representations
Magnitude
Tempo
Pitch
Chord Progressions

Feature Selection

IGR
Classification

Conclusion and Future Work

- Pitch is a perceived characteristic contained in the frequency of music content.
- Most music of the same genre exhibit melodies that are just combined notes from a scale set.
- However, often environmental sounds overtone pitch, disguising available pitch related elements, which make it difficult to extract pitch computationally.
- Therefore, some sort of pitch extraction mechanisms need to be adopted to retrieve these pitch elements though the environmental sounds.

Magnitude
Tempo
Pitch
Chord Progressions

Feature Selection

IGR
Classification

Conclusion and Future Work

- Introducing spectral feature extraction to genre detection problems created opportunities to exploit single characteristics of music.
- Chord structure and progressions has been a defining trait of music for many years but had gone unnoticed in recent music genre detection schemes.

I	ii	iii	IV	V	vi	vii

Information Gain Ranking

We could have chosen up to 100 features and achieved between 70-75% classification accuracy, but doing this would bias the learning model to this particular dataset.

Features Maintained (459)

Spectral Flux (MFCC 4)
Spectral Variability (MFCC 4)
Compactness (Mean + SD 2)
MFCCs (MFCC 52)
Peak Centroid (Mean + SD 2)
Peak Smoothness (SD 1)
Complex Domain Onset Detection (Mean 1)
Loudness (+ Sharpness and Spread) (Mean 26)
OBSI (+ Radio) (Mean 17)
Spectral Decrease (Mean 1)
Spectral Flatness (Mean 20)
Spectral Slope (Mean 1)
Shape Statistic spread (Mean 1)
Spectral Centroid (MFCC 4)
Spectral Rolloff (SD 1)
Spectral Crest (Mean 19)
Spectral Variation (Mean 1)
Autocorrelation Coefficients (Mean 49)
Amplitude Modulation (Mean 8)
Zero Crossing + SF (MFCC 8)
Envelope Statistic Spread (1)
LPC and LSF (Mean 12)
RMS (Mean + SD 2)
Fraction of Low Energy (Mean 1)
Beat Histogram (SD) (171)
Strength of Strongest Beat (Mean 1)
Temporal Statistic Spread (Mean 1)
Chroma (MFCC 48)

Features Eliminated (223)

Peak Flux (20-bin FH 20)
Peak Smoothness (Mean 1)
Shape Statistic centroid, skewness and Kurtosis
Strongest Frequency of Centroid (MFCC 4)
Spectral Rolloff (Mean 1)
Strongest Frequency of FFT (MFCC 4)
Envelope Centroid, Skewness and Kurtosis (Mean 4)
Beat Histogram (Mean 171)
Strongest Beat (Mean + SD 2)
Strength of Strongest Beat (SD 1)
Fraction of Low Energy (SD 1)
Beat Sum (MFCC 4)
Relative Difference Function (MFCC 4)
Temporal Statistic Centroid, Skewness & Kurtosis

Automatic Music Genre Classification

Classifying 10 GTZAN genres

- Although the multilayer perception takes a significant time to build and evaluate, it notably outperforms the naïve Bayes and the SVM.
- The K-NN and RF take the least time to build and evaluate and produce sufficient results.
- The LLRM provides the best classification score.

Classifier	Accuracy	Time to build model	Time to evaluate model
Naïve Bayes	46.40%	0.11 sec	2.13 sec
Support vector machines	32.50%	6.04 sec	38.12 sec
Multilayer perceptron	63.70%	635.37 sec	6 hours 20.12 sec
Linear logistic regression models	81.00%	20.25 sec	10 mins 31 secs
K-nearest neighbours	72.80%	0.02 sec	13.12 sec
Random forests	66.60%	0.22 sec	3.76 sec

Table: Classification of the thinned feature vector

Linear Logistic Regression Classification

LLRM 10-fold CV on 10-GTZAN Genres

G1 = Blues, G2 = Classical, G3 = Country, G4 = Disco, G5 = Hiphop, G6 = Jazz, G7 = Metal, G8 = Pop, G9 = Reggae, and G10 = Rock.

	G1	G2	G3	G4	G5	G6	G7	G8	G9	G10
G1	84	0	3	3	0	5	1	0	2	2
G2	0	96	1	0	0	2	0	0	0	1
G3	3	0	77	2	0	4	0	1	3	10
G4	1	1	5	76	2	0	0	4	5	6
G5	1	0	0	1	85	0	4	3	6	0
G6	3	4	5	1	0	82	1	2	1	1

Conclusion and Future Work

- Humans who observe cultural features not content based features
- Large scale musical structures are present in most music genre types (RNNs)
- Compile quality datasets with masterful labelling
- Construct datasets based on different characteristics that a genre learning model should exhibit and detect
- The musicality of a listener can be used to satisfy a particular customer's genre preference
- The pallet of genre labels used
- Current genre labelling places albums and artists into genre catalogues.
- A promising approach is performing multi-label automatic classification, which offers a solution to the fuzziness between genre definitions.
